A project of the Eleventh Edition 2017
Acknowledgments

The original Marin County Stroke Resource Directory was published in 1988 and we gratefully continue to build upon the excellent work of those involved. The collaborative effort included Dottie Breiner, Maureen Green, Carol Howard-Wooton, Suzy Coxhead, Nancy Boyce of MarinLink, and Susan Jensen.

Thank you to John Panagotacos, MD, J. Richard Medius, MD, and Deborah Doherty, MD, for providing the medical perspective. We are also indebted to John Pamplin, who volunteered countless hours and substantial funds in establishing this “go-to” site for stroke resource information.

In recent years, the book has been updated with the guidance of editor-in-chief Nancy Boyce and the technical assistance and perseverance of editor and MarinLink volunteer Deborah Learner. We are also grateful for the cooperation and input of our many resource providers throughout Marin County and beyond.

The current edition has been compiled by MarinHealth Medical Center with the assistance of Nancy Boyce.

Glossary .....................................................................................................................57
A STROKE IN THE FAMILY AFFECTS EVERYONE IN THE FAMILY, NOT JUST THE STROKE SURVIVOR.

The purpose of this booklet is to make it easier for all those touched by stroke to find the various support services now available and helpful for successful recovery. We strongly encourage you to seek out and use these community services. We understand that asking for help—even needing it—may be new for you, but adapting to and coping with such a catastrophe usually demands more than can be done alone.

Almost all of the resources included in this booklet have their own websites, and we encourage you to visit them, since they contain extensive information about the services they provide.

The information and resources listed here are not intended to be an endorsement, nor are the listings all-inclusive. This directory includes information that has proved useful to stroke survivors and their families. While we have tried to check all resources as thoroughly as possible, we apologize in advance for any errors or omissions.

We hope that this Resource Directory will help you avoid the frustration of not knowing where to turn in your time of need, and that you will remember that there is life after stroke, for both the survivor and the survivor’s family.

“Disability is the one minority that anyone can join at any time.”

– Daniel Barnes, Marin Center for Independent Living
What Is a Stroke?
A stroke occurs when the blood supply to a part of the brain is reduced or cut off. As a result, the brain cells, called neurons, in that part of the brain cannot function. When this happens, the part of the body controlled by these neurons cannot function normally. The results of a stroke may be weakness, loss of sensation or feeling, paralysis on one side of the body, and difficulty with vision, walking, speaking, and understanding. Strokes, or “brain attacks,” are very individual; rarely are two alike, even though the causes may be similar.

What Causes a Stroke?
There are three major medical causes of stroke:

**Thrombotic Stroke:** A clot or thrombus forms inside an artery in the brain or neck. It may be related to atherosclerosis or abnormal thickening of inner arterial walls.

**Embolic Stroke:** A wandering blood clot. It may result from heart damage or be a small piece of a larger clot in the neck. Blood carries the clot to the brain where it blocks a small artery.

**Cerebral Hemorrhage:** A blood vessel in the brain bursts, flooding surrounding tissue with blood. It may be related to high blood pressure and atherosclerosis. It may be caused by a head injury, a bursting aneurysm, or long-standing high blood pressure.

For more complete information, see Strokes: A Guide for the Family, an American Heart Association pamphlet.

What Are the Typical Results of a Stroke?
The site and extent of the stroke determine the results or deficits for each person. In general, the brain is divided into right and left hemispheres. The brain stem and cerebellum are at the base. You may see or experience some of the following:

**Right Hemisphere Injury:** Left-side paralysis (hemiplegia or hemiparesis); excessive talking; short attention span; impulsive, quick behavioral style; memory problems; spatial-perceptual problems

**Left Hemisphere Injury:** Right-side paralysis (hemiplegia or hemiparesis); speech and language deficits (aphasia); slow, cautious behavioral style; memory deficits

**Brain Stem:** Coma or low-level consciousness; unstable vital signs; nausea and vomiting; impaired swallowing; bilateral paralysis

**Cerebellum:** Coordination and balance problems (ataxia); dizziness, nausea and vomiting; abnormal reflexes of head and trunk

For more complete information, see these pamphlets by the American Heart Association: How Stroke Affects Behavior, Caring for a Person with Aphasia, and The One-Handed Way.
What Happens During Hospitalization?
The diagnosis of stroke is made through a variety of procedures: angiogram, CT and MRI scan, EKG, and echocardiograms, (see Glossary for definitions of these and other terms). Appropriate treatment and medication may be administered, and surgery is sometimes needed.

How Long Will Rehabilitation Take?
While some recovery of function is spontaneous during the first six months following a “brain attack,” most experts now agree that major recovery occurs in the first 18 months. Some research suggests that recovery can continue beyond this mark. Successful recovery depends on the extent of brain damage, the survivor’s attitude, the cooperation of family and friends, and the skill of the rehabilitation team.

The rehabilitation team may consist of a number of specialists: physiatrist, neurologist, neuropsychologist, occupational therapist (OT), physical therapist (PT), speech-language pathologist (SLP or ST), case manager, and recreational therapist (RT). In addition, your regular doctor, sometimes referred to as a PCP or primary care provider, may coordinate overall care. (Refer to the Glossary at the end of this directory for further information about these specialists.)

How Do I Know the Extent of Brain Damage?
Multidisciplinary evaluations by a rehabilitation team will help determine the extent of neurological injury and help plan strategies for recovery. Physical therapy (PT), occupational therapy (OT), speech-language and swallowing therapy (ST), and neuropsychological assessments will help you understand specific strengths and limitations in the areas of mobility, self-care, speech, language, cognition, behavior, and mood. An initial or baseline evaluation can be useful in setting realistic goals and tracking progress over time. Reevaluation may be appropriate as recovery progresses over a number of years.

How Do I Arrange for an Assessment?
Most stroke survivors go through an initial period of rehabilitation following discharge from the acute care hospital, either in an acute care rehab hospital, a skilled nursing facility with an active rehab team, a home health agency, or an outpatient clinic. Multidisciplinary evaluation and family training in post-stroke issues are generally part of this rehabilitation. If you require an evaluation, your primary physician can generally make a referral, either to a specific practitioner or to a rehabilitation team. Going through your primary physician for a referral also maximizes the possibility that the cost of the evaluation will be covered by insurance.

What Is a Neuropsychological Evaluation?
A neuropsychologist is a licensed clinical psychologist with special expertise in brain function. Neuropsychological assessment can provide more in-depth evaluation of a variety of cognitive skills such as memory (verbal and visual), sequencing, and reasoning (both verbal and visual-spatial). Neuropsychological assessment also looks at the behavioral, emotional, and social consequences of brain injury. This in-depth look at verbal and nonverbal thinking skills can be of particular value in setting realistic goals and assessing employment potential if one is considering returning to work. Neuropsychological assessment may not routinely be a part of a multidisciplinary evaluation, but most rehabilitation facilities have staff neuropsychologists or can recommend one. Your primary physician may also be able to make a referral. The California Employment Development Department (Department of Vocational Rehabilitation) may provide some neuropsychological assessment at no cost if the stroke survivor is a client.
What Affects the Survivor's Attitude?
This is complex. Some of the factors include life stage, gender, previous medical history, pre-stroke personality and attitude, and the quality of family and social relationships. Altered brain function may initially result in frequent tearfulness or laughter that is not always appropriate to the situation. Family members who understand the origin of any changed behavior will be able to learn how best to respond in order to maintain the stroke survivor’s motivation. The survivor has sustained numerous losses—mobility, income, speech, thinking ability, independent functioning, and social role—in a very short time. The sense of who one is in the world and the sense one has made of the world may no longer hold true. The experience of being a patient may be frustrating or frightening for someone used to managing his or her own life. At this time of crisis, an essential aspect of the self may clearly reveal itself. Whatever comes forward must be met with interest, curiosity, and care to convey the belief that a whole person still exists amidst all the wounds.

What Helps Families Cooperate?
Initially, the primary caregiver will be the person most involved in making the necessary medical decisions. Clear, honest communication between family members is usually helpful. Hospital social workers may be able to facilitate communication between family members or between family and medical staff if there are areas of conflict. The rehabilitation team should include and educate family members about progress made and discharge planning.

What Are Some Common Problems Families and Caregivers Encounter?
Typically, during the acute phase, family and friends rally. The primary caregiver is often completely focused on the patient, forgetting about himself or herself. The caregiver needs as much support and acknowledgment as the stroke survivor. The transition from hospital to home may be an especially difficult time for everyone. Anxiety, depression, and social isolation are common. Colleagues, friends, and even some family often stop calling or visiting in the months to come because of their own discomfort. Caregivers may need to establish new support networks to maintain their own mental, physical, and spiritual well-being. Even if it feels uncomfortable, caregivers should be willing to ask for and accept help from family and friends.

What May Help Communication?
Communication will be a challenge for families if speech and language processing are affected by the stroke. The person who has had a stroke may have difficulty speaking, or use inaccurate or inappropriate words to communicate, without being aware that he or she is doing so. It is important to be as patient and honest as possible. If the caregiver doesn’t understand what is being said, it is important to let the person know. Look for alternative ways for the stroke survivor to express himself or herself, such as pointing or gesturing. Try to ask questions that permit a yes/no or headshake answer. The caregiver may also want to encourage the person to speak more slowly, or take a deep breath to reduce stress and frustration.
What Supports Mobilization?
Motivation is essential for mobilization. The more the stroke survivor is involved in deciding important goals in collaboration with the rehab team, the more likely he or she is to be motivated to persist in the hard work of recovery. Support groups offer members praise, encouragement, and understanding, and often reinforce behavioral change. They also provide new social connections during a period that is often lonely.

Are There Predictable Stages of Recovery?
Everyone touched by stroke is grieving the loss of the pre-stroke person, while the survivor is simultaneously regaining function and rebuilding a sense of self. Recovery involves both letting go of the old identity and constructing a new one, which may include some diminished capacities.

- **SHOCK** is the first stage of recovery, and may be accompanied by numbness, fear, and helplessness.

- **DENIAL** is the second stage. Refusal to face the effects of the stroke may protect the survivor and the family from feeling overwhelmed and provide time for adjustment to new realities.

- **ANGER/DEPRESSION**, both of which are typical responses to loss, may be complicated by damage to the brain. If anger and/or depression persist, clinical intervention and even antidepressant medication may be beneficial. Participation in a stroke support group may also help.

- **MOBILIZATION**, the fourth stage, brings an interest in setting and accomplishing goals.

- **COPING** is the final stage. This involves adaptation to a life with new limitations, priorities, and interests.

What Can I Hope For?
Unfortunately, 25 percent of stroke patients do not survive the first year, and many who do survive are unable to return to work. A small percentage of stroke survivors, particularly those who are young (one-third of all stroke survivors are under age 65), may fully recover. Even with some degree of disability, many survivors do resume active and meaningful lives. Resilience, resources, and newly discovered skills may enable survivors and families to adapt and meet the challenge of multiple losses and changed expectations, to recreate meaning and purpose in their lives.

Recovery requires persistent hard work.
**Will It Happen Again?**
This is a major concern because the risk of stroke for someone who has already had one is much greater than for someone who has not. Therefore, it is important for the stroke survivor, family members, and friends to recognize the symptoms of stroke and transient ischemic attack (TIA).

**What Are the Symptoms of Stroke and Transient Ischemic Attack?**
If the symptoms come and go, or fade rapidly (in minutes to hours), then a transient ischemic attack (TIA) may have occurred. Both stroke and TIA may begin with these symptoms:

- Sudden weakness or numbness of the face, arm, and/or leg
- Sudden double vision, loss of vision, or blurred vision in one or both eyes
- Sudden, severe headache
- Trouble speaking or understanding
- Sudden difficulty swallowing
- Unexplained dizziness, unsteadiness, or sudden falls—especially along with any of the above

**A Quick Test for a Stroke – BE FAST**

**Balance**  
Does the person have a sudden loss of balance?

**Eye**  
Has the person lost vision in one or both eyes?

**Face**  
Ask the person to smile. Look for facial droop or a lopsided grin.

**Arm**  
Have the person close his or her eyes and hold both arms out with palms facing up. Look to see if one arm drifts down, or if he or she experiences weakness, tingling, or inability to move an arm or leg

**Speech**  
Check to see if the person is slurring words, speaking nonsense, or not able to talk at all.

**Time**  
Note the time the symptoms started or the last time the person was noted to be well. Time lost is brain lost.

**REMEMBER: TIME IS BRAIN!**

**What Should You Do?**
**CALL 911 IMMEDIATELY. DO NOT IGNORE THE SYMPTOMS.**
New medications available may minimize the damage from a stroke or even reverse all the symptoms.

“It is part of the cure to wish to be cured.”
—Seneca (3 B.C. – A.D. 65)
What Can You Do to Reduce the Risk of Stroke?

- Maintain a regular schedule of medical check-ups—especially if you are diabetic or have heart disease, abnormal heart rhythms, or hypertension.
- Monitor your blood pressure, eat a healthy diet, maintain the proper weight, exercise, and—if necessary—take medication.
- Stop smoking—your risk of stroke from smoking can be eliminated in one year.
- Monitor blood or urine glucose and acetone levels if you are diabetic.
- Get frequent medical monitoring if you take oral contraceptives or smoke.
- Regular aerobic exercise, such as walking and swimming, maintains a healthy cardiovascular system; consistency and enjoyment are important aspects of any exercise program.
- Learn and practice stress-reduction techniques.
- Monitor blood cholesterol and lipids; learn about nutrition and your health; and modify your diet as recommended by your physician or nutritionist.
- Learn about your body, what it likes and what creates feelings of well-being, such as music, dance, and fresh air.

There is a range of treatment options and long-term care choices for stroke survivors and their families.

**Acute Care:** This is the early hospitalization stage where medical needs are primary. Initial rehabilitation may begin at this time.

**Inpatient Rehabilitation:** In either an acute care rehabilitation hospital or a skilled nursing facility, the stroke survivor receives early and relatively intensive therapy. An acute rehabilitation facility is specifically licensed and provides more physician management than a post-acute rehabilitation or skilled nursing facility, which may also provide inpatient rehabilitation.

**Home Healthcare:** Licensed home health agencies provide skilled nursing care and rehabilitation in the home. (See Home Healthcare listings online under “Nurses” and “Nurse Registries.”)

**Outpatient Rehabilitation:** Rehabilitation therapy is provided by licensed professionals, such as speech therapists, occupational therapists, and physical therapists. (See the Rehabilitation section in this directory.)

**Skilled Nursing Facilities (SNF):** Skilled nursing facilities or convalescent hospitals provide custodial care for stroke survivors who require assistance and supervision in their daily activities. Inpatient rehabilitation may also be available in a SNF. (See the Rehabilitation section in this directory and listings online under “Nursing Homes.”)

“The healing system is the way the body mobilizes all its resources to combat disease. The belief system is often the activator of the healing system.”

– Norman Cousins
Healthcare: Levels of Care (continued)

Residential Care: Many different facilities over a range of group living situations and some custodial care for stroke survivors. (See listings online under “Retirement Homes” and “Rest Homes.”)

Adult Day Health Services: These centers provide maintenance therapies, activities, and custodial care.

Home Care: Private agencies provide contract home health aide and attendant care for in-home custodial care needs. (See the Home Healthcare section in this directory.)

Community: Programs such as the Schurig Center for Brain Injury Recovery provide direct services and information on continued rehabilitation and maintenance options.

The agencies listed below provide a wide range of services for the elderly and disabled, including medical information and community services. They can be considered a “one-stop shop.” These leading agencies are a good place to initiate a quest for information and services.

Rehabilitation Services

The goal of medical rehabilitation is to assist the stroke survivor to improve in day-to-day functional activities, including mobility, self-care, communication, and socialization. Returning to community activities and routines outside the home are also goals. Hospitals typically have physical therapy, occupational therapy, and speech language pathology services. These services may be available to inpatients and outpatients with a physician’s prescription and authorization by the insurance company.

HOME HEALTHCARE

Professional services in the home are provided by a licensed healthcare professional (occupational or physical therapist, speech pathologist, registered nurse, licensed vocational nurse, licensed medical social worker, or certified home health aide). A referral and a prescription from a physician are required. Professional services in the home, when medically necessary, are sometimes covered by Medicare, Medi-Cal, or private insurance. Also see listings in your local Yellow Pages under “Nurses” and “Nurse Registries.”

Marin County Department of Health & Human Services, Division of Aging and Adult Services
1-415-457-4636
For information about local home healthcare organizations you can request a copy of the Marin Home Care Collective brochure by calling the Marin County Department of H&HS, Division of Aging and Adult Services.
www.MarinHCC.org
IN-HOME SUPPORT SERVICES

For non-medical services in the home, such as housekeeping, assistance in bathing, eating, dressing, meal preparation, supervision, and companionship, some nursing services also employ health aides. These services are termed “custodial” and are seldom covered by insurance and must be paid for privately.

The Marin County Department of Health and Human Services, Division of Aging and Adult Services, offers a brochure entitled Marin Home Care Collective, listing private in-home support service providers.

  Kentfield, CA 94904
  www.kentfieldrehab.com
  Individual neuropsychological assessment and cognitive retraining, including computer-assisted instruction.

- **Schurig Center for Brain Injury Recovery**
  1-415-461-6771
  1132 Magnolia Avenue
  Larkspur, CA 94939
  www.schurigcenter.org
  Multiservice resources, stroke and caregiver support groups, educational and pre-vocational training, counseling, neuropsychological assessment and consultation, adult day health services, resource referral services, occupational therapy assessment and consultation, and art therapy.

**COUNSELING AND PSYCHOTHERAPY**

The need for counseling and psychotherapy is normal when life is affected by any catastrophic illness. Because the onset of stroke is sudden and acute, a great deal of disruption occurs in the lives of everyone involved. Counseling can be of enormous help in making the needed adjustments and decisions in the lives of stroke survivors, their families, and caregivers as they deal with the changes in physical, emotional, behavioral, social, and family role status.

Mental health and social service professionals can assist stroke survivors and their families in understanding and resolving the psychological and social stresses of the stroke experience.

Look for a licensed professional familiar with the area of stroke. The following organizations can provide referrals:

- **California Association of Marriage and Family Therapists – Marin County Chapter**
  1-415-459-3484
  P.O. Box 9065
  San Rafael, CA 94912
  www.marincamft.org

- **Center for Attitudinal Healing – North Bay**
  1-415-457-1000
  www.cah-northbay.org
  E-mail: centerforah@gmail.com

- **Community Institute for Psychotherapy**
  1-415-459-5999
  1330 Lincoln Avenue, Suite 201
  San Rafael, CA 94901

HEALTH INSURANCE

Medicare and most private insurance policies will provide coverage for rehabilitation following a stroke. The exact services and time periods covered vary from policy to policy. Skilled nursing care, speech, occupational and physical therapy, and medical social work are services usually covered for inpatient and outpatient rehabilitation and in-home rehabilitation.

Medicare and most insurance policies do not cover custodial care. Custodial care is ongoing personal care and supervision often needed by stroke survivors. Very few insurance policies cover custodial care in the home or in a skilled nursing facility. Medi-Cal covers custodial care in a skilled nursing facility for low-income individuals. Descriptions of the levels of care available to stroke survivors indicate whether the services are considered rehabilitative or custodial (i.e., whether or not the services are generally covered by Medicare and/or private insurance).

Health Insurance Counseling and Advocacy Program (HICAP)

Senior Advocacy Services 1-800-434-0222
3262 Airway Drive, Suite C
Santa Rosa, CA 95403
www.cahealthadvocates.org

Provides objective information and assistance to people who need help in understanding Medicare, supplemental (Medigap) insurance, long-term care insurance, senior HMO plans, and assistance with Medicare billing and claims.

Government-Funded Health Insurance

Medicare is a federal health insurance program administered through the Social Security Administration. It is available to most Americans over the age of 65. However, if you are under age 65 and disabled, you may also be eligible for benefits.

Medicare hotline 1-800-633-4227/1-800-MEDICARE

120 North Redwood Drive – West Wing
San Rafael, CA 94903

National Insurance Consumer Helpline 1-800-942-4242
For information on health insurance issues and free consumer guides.

Private Health Insurance

Patients who have private health insurance policy through their employer and/or their spouse’s should contact the employer(s)’ human resources department. Many private insurance companies now have case managers to help people understand their coverage.

The State of California offers a special program for private insurance applicants who are denied individual coverage. Their premium is partially subsidized by the State of California. People may qualify to apply for this program if they have been denied coverage from a private health plan. Call for further information.

Managed Risk Medical Insurance Board (MRMIB)
Administered by Blue Cross 1-800-289-6574

Research the latest treatments, look up information on a drug or supplement, find out the meanings of words, or view medical videos or illustrations. Get links to the latest medical research on a topic or find out about clinical trials on a disease or condition.
INTEGRATIVE THERAPIES

Many stroke survivors have found complementary and alternative therapies beneficial. These may include acupuncture, acupressure, massage therapy, aromatherapy, expressive art therapies, and a variety of movement therapies such as Qi Gong and Feldenkrais. While research is being conducted on the objective efficacy of many of these therapies, anecdotal evidence suggests that they can be valuable to stroke survivors working through the many transformations of post-stroke life. Some of these therapies may simply provide much needed stress reduction, whether or not they promote more specific healing. Caregivers might also benefit from these therapies.

Kaiser Permanente Medical Center  1-415-444-2173
99 Montecillo Road
San Rafael, CA 94903
www.kp.org

An extensive health education program provides offerings in complementary and alternative care, including the Feldenkrais Method, mindfulness-based stress reduction, yoga, and Qi Gong.

Free medical computer searches and lending library on any health topic.

MEALS

SF – Marin Food Bank 1-415-883-1302
75 Digital Drive
Novato, CA 94949
www.sfmfoodbank.org
Provides emergency food for low-income seniors and families. Stock food pantries throughout the county. Check website or call for locations and hours.

Marin Meals on Wheels 1-415-457-4636
Marin County Department of Health and Human Services Division of Aging and Adult Services
10 North San Pedro Road, Suite 1023
San Rafael, CA 94903

Whistlestop – Jackson Café 1-415-456-9062
930 Tamalpais Avenue
San Rafael, CA 94901
www.whistlestop.org
Nutritious and low-cost lunchtime meals, Monday through Friday.

PARENTING

Through the Looking Glass 1-510-848-1112
3075 Adeline Street, Suite 120
Berkeley, CA 94703
www.lookingglass.org
Provides direct services, information, and referral to a diverse group of parents, including those with physical and visual disabilities. Includes consultations and an information and referral center.

PETS

Canine Companions for Independence 1-707-577-1700
2965 Dutton Avenue
Santa Rosa, CA 95407
www.cci.org
Service dogs.

Discovery Dogs 1-916-295-1828
P.O. Box 582
Roseville, CA 95661
www.discoverydogs.org
Assistance dog training for people with physical disabilities.
SHARE: Special Human and Animal-Related Experiences.
“Side-by-Side” is a program of the Marin Humane Society to keep people and their pets together. Offers care and feeding assistance for pets of disabled, elderly, and people with AIDS. Services include pet food (home delivery, if necessary), veterinary care, grooming and flea control, dog walks, free spay/neuter and vaccinations, dog licenses and cat I.D. tags, and emergency boarding. No fee or sliding-scale fee when applicable.

RECREATION AND TRAVEL
(See also EXERCISE AND FITNESS Section.)
Travel is becoming easier for persons with disabilities, but one must ask the right questions to find fully accessible lodgings. Ask if the shower is a “roll-in” shower, suitable for a wheelchair, with grab bars and a bench to sit on; some hotels consider a high-sided tub with grab bar or two as “accessible,” but that may not meet the needs of many people with impaired mobility.

Access Northern California (ANC) ........................................ 1-510-524-2026
www.accessnca.com

Barrier-Free Travels .......................................................... 1-209-599-9409

5821 Florin Perkins Rd.
Sacramento, CA 95828
For additional resources, see online listings under “Van Conversions,” “Van Accessories,” and “Wheelchair Lifts and Ramps.”

Smith OT and Driving Rehabilitation Services 1-415-847-2098
www.smithotanddriving.com
Driving evaluation program, training, and recommended adaptations or equipment needed to provide greater safety.
UTILITIES

Gas and Electric
PG&E’s Medical Baseline Allowance Program allows electric and gas baseline allowances to be increased with a doctor’s confirmation. PG&E offers information on finding ways to pay utility bills, how to weatherize homes, and how to find other types of help in the community regarding energy needs. Assistance is provided by PG&E and other community human service agencies.

PG&E Customer Assistance Program 1-800-743-5000
www.pge.com (See “Customer Services”)

Telephone
California Telephone Access Program (CTAP) 1-800-806-1191
www.ddtp.org/ctap

This program provides products and services to assist with telephone use (e.g., speaker phones, large dial pads) free of charge.

Television
Some cable companies may offer reduced fees for older adults or disabled persons receiving Social Security Disability Income (SSDI) or Supplemental Social Security Income (SSI). Check with local cable provider.

This glossary of terms is not all-inclusive, but is an attempt to provide some understanding of words heard frequently about the stroke survivor’s condition, diagnosis, and tests.

Abbreviations: See definitions under longer names.
ADL: Activities of Daily Living
AFO: Ankle-Foot Orthotic
CVA: Cerebral Vascular Accident
CVD: Cerebral Vascular Disease
OT: Occupational Therapist or Occupational Therapy
PCP: Primary Care Provider (family physician)
PT: Physical Therapist or Physical Therapy
ROM: Range of Motion
RT: Recreational Therapist or Recreational Therapy
ST: Speech Therapist or Speech Therapy
SLP: Speech Language Pathologist

Activities of Daily Living (ADL): Activities of daily hygiene (washing, brushing teeth, etc.), as well as dressing, grooming, eating, and drinking; sometimes locomotion or mobility activities, such as standing up, sitting down, walking, and calisthenics, are included.

Agnosia: Loss of ability to recognize objects or symbols through a particular sensory channel (vision, hearing, touch, smell, taste). Patient may not, for example, know what to do with a bar of soap or a pair of glasses.

Ambulation: The act of walking with or without assistive devices or braces.

Aneurysm: The ballooning of the wall of an artery due to either congenital defect or weakness of the wall of the artery. One of the leading causes of stroke in younger people.
**Angiogram:** An X-ray picture of blood vessels after a dye has been injected, used by physicians to assess the functioning of the blood vessels.

**Ankle-Foot Orthotic (AFO):** Brace used to support weak or paralyzed ankle and foot muscles to simulate normal joint movement, enhance walking ability, and prevent further injury.

**Aphasia:** A loss or impairment in the ability to use and/or understand language. This loss may manifest itself in various ways—speaking, writing, reading, and understanding.

**Apraxia:** Loss of ability to carry out purposeful, voluntary movements without the presence of paralysis, muscular weakness, or an impairment of sensation. Can be found in speech, sensory, oral, and motor activities.

**Arteriogram:** X-ray to determine whether an artery is open or blocked, weak, or damaged.

**Arteriosclerosis:** Also known as “hardening of the arteries,” caused by the ongoing process of atherosclerosis.

**Atherosclerosis:** Caused by gradual build-up of lipids, cholesterol, proteins, and calcium, which together form plaques in arteries. This build-up may eventually result in complete blockage of the artery (occlusion).

**Brain Damage:** Injury to the tissue of the brain as a result of illness, trauma, birth defect, or disease.

**Carotid Artery:** Principal artery in the neck responsible for carrying blood to the brain.

**CT Angiography:** A computerized X-ray of the blood vessels of the brain after dye has been injected. A physician uses this to assess the functioning of the cerebral blood vessels.

**CT Scan:** Computerized X-ray technique used to assess effective functioning of various parts of the body.

**Cerebral Vascular Accident (CVA):** Damage to the brain caused by an accident in the vascular system (blood vessels). This vascular damage may be manifested as thrombosis (clot), embolism (blockage), or hemorrhage (bleeding).

**Cerebral Vascular Disease (CVD):** Condition of chronic or progressive restriction of the circulation in the brain, resulting in recurrent TIAs; precursor of stroke or CVA.

**Cognitive Retraining:** Also referred to as “cognitive remediation,” “cognitive rehabilitation,” and “cognitive therapy.” Refers to systematic, individualized retraining in specific thinking skills lost or damaged through brain injury. These specific skills may include memory, thought organization, problem-solving, mathematics, and/or language arts. Computer-assisted learning may be part of a cognitive program. Professionals involved in cognitive retraining may be neuropsychologists, speech language pathologists, and/or occupational therapists.

**Dysarthria:** Impairment in articulation. Speech will be slurred with distortion, substitution, or omission of sounds. May be accompanied by drooling and facial weakness.

**Dyslexia:** Impairment in the ability to read and understand the written word.

**Dysphagia:** Impairment in swallowing.

**Edema:** Swelling of body parts due to excessive fluid in the tissue spaces.

**Electroencephalogram (EEG):** Recording of energy or activity generated by nerve cells in the brain.
**Electrocardiogram (EKG):** Graphic tracing of electric current produced by heart muscle.

**Embolism:** The sudden blocking of an artery or vein by a clot carried by the bloodstream from one part of the body to the point of obstruction; one cause of stroke.

**Emotional Lability:** Emotional response of greater magnitude than a situation warrants. Usually manifests as excessive or inappropriate laughing or crying.

**Gait:** Manner of walking; normal gait cycle has a swing phase and a stance phase for each lower limb. Gait training: specific therapeutic neuromuscular techniques used by a physical therapist on trunk and limbs, combined with instructions to the patient for enhancing muscle responses for improved walking pattern.

**Hemiparesis:** Weakness on one side of the body; may include head and neck, trunk, and limbs.

**Hemiplegia:** Paralysis, or loss of voluntary motion, on one side of the body; may include head and neck, trunk, and limbs.

**Hypertension:** High blood pressure. A condition in which a person has a higher than normal blood pressure. Hypertension makes people very susceptible to stroke.

**Echocardiogram:** A noninvasive diagnostic ultrasound of the heart. This procedure uses sound waves to create imaging of the heart and the veins and arteries that surround it.

**Ischemia:** Lack of oxygen in a localized area of the body, such as in part of the brain in a stroke.

**Jargon:** Speech that makes little sense and is difficult to understand. Speech is frequently a combination of real words and made-up vocabulary.

**MFT:** Marriage and family therapist. Mental health practitioners educated and trained to help with relationship difficulties, the diagnosis and treatment of mental disorders, and the emotional problems of individuals, couples, families, and groups.

**Motor:** Refers to movement generated by messages from the brain, resulting in the smooth interaction of nerves and muscle.

**MRI:** Magnetic resonance imaging is computer-facilitated imaging of various parts of the body for diagnostic purposes.

**Neglect:** The problem of ignoring the paralyzed side, often seen after a stroke.

**Neuropsychology:** Neuropsychology is the study of the behavioral expression of brain injury. A neuropsychologist is a licensed clinical psychologist with special expertise in brain function. He or she evaluates and treats the cognitive, behavioral, emotional, and social consequences of brain injury. The neuropsychologist can also help the stroke survivor’s family to understand and better cope with associated changes.

**Occlusion:** Blockage or obstruction.

**Occupational Therapy (OT):** Occupational therapists evaluate and treat the skills needed for independent daily living. These include grooming and hygiene, eating, upper body strengthening, fine motor coordination, visual perceptual, and cognitive skills. In addition, they assist with adaptive homemaking skills, community reintegration, and pre-vocational assessment. When indicated, they will conduct home and/or workplace evaluations.
**Orthotics:** Orthotics are prescription, custom-fit braces that assist patients with mobility. The most common are AFOs (ankle-foot orthoses) and KFOs (knee-ankle-foot orthoses). A patient’s physical therapist will often work with the orthotics to come up with the best option. Medicare and Medi-Cal cover orthotics in most cases and private insurance companies give approval on a case-by-case basis.

**Paresis:** Weakness of a muscle or group of muscles due to disease or injury to the neuromuscular system.

**Passive Exercises:** Movement of a paralyzed limb to keep muscles in good condition and facilitate possible return of movement. Supervised by a physical or occupational therapist.

**Perseveration:** Impairment resulting in continued repetition of a movement or a word, which no longer is appropriate for the situation; a common problem after stroke.

**Physiatrist:** Physician specialist in physical medicine; member of rehabilitation team who cares for medical complications during rehabilitation.

**Physical Therapy (PT):** Physical therapists evaluate physical abilities and treat muscle tone, strength, endurance, balance, coordination, and joint flexibility. They provide posture and gait training, therapeutic exercise, wheelchair, and assistive device management.

**Range of Motion (ROM):** Amount of movement in limbs and joints. Included are active and passive exercises performed under the direction of a physical therapist to stimulate movement.

**Recreational Therapy (RT):** The use of recreational or leisure time activities as a therapeutic part of the rehabilitation process.

**Sensory:** Pertaining to the functioning of the five senses: smell, touch, hearing, vision, and taste. Messages are received through the sensory channels.

**Spasticity:** A state of increase over normal tension (tone) of a muscle, resulting in continuous resistance to stretching.

**Speech Therapy (ST):** Speech-language pathologists (SLP) evaluate and treat communication and swallowing disorders resulting from stroke. Treatment may address speech production, language comprehension and expression, reading, writing, gestural communication, and cognitive functions such as memory and reasoning.

**Spontaneous Recovery:** Refers to the gradual early recovery from the stroke, usually in the absence of professional help. May be the result of the reduction of brain swelling, reabsorption of blood, reduction of inflammation, and influence of environment.

**Subluxation:** Incomplete dislocation, usually of shoulder joint, after stroke.

**Transfers:** Movement from one position to another, usually from one seat to another, such as from bed to chair, wheelchair to car, etc.

**tPA:** Tissue plasminogen activator, a “clot-busting” drug that can be used in the treatment of acute ischemic stroke when there is no evidence of intracranial hemorrhage and patients can be treated within three hours of symptom onset. If administered intra-arterially, tPA can be administered within six hours of symptom onset.

**Transient Ischemic Attack (TIA):** A brief or temporary episode of neurological symptoms, such as blurred vision or speech, numbness or weakness, or loss of balance, which may disappear.

**Visual Field Defect:** Refers to impaired vision affecting the outer half of one eye and the inner half of the other. Similar to a “blind spot.”
